

WEEK 3 PROJECT REPORT

Project Title: Ludo Star Game

Introduction

In Week 3, I focused on improving the design of the Ludo board and adding player pieces to the game interface. In the previous week, I created the basic GUI window with buttons and a simple board layout. This week, the goal was to make the game look more like an actual Ludo game.

Work Completed

During this week, I completed the following tasks:

- Improved the overall appearance of the Ludo board.
- Created four player home areas using the standard Ludo colors: Red, Green, Blue, and Yellow.
- Added player tokens inside each home area.
- Created a center home section on the board.
- Added path squares around the center area to represent future token movement paths.
- Improved the board layout using Java Graphics.
- Kept the Roll Dice, New Game, and Exit buttons functional.

Tools and Technologies Used

- Java
- Java Swing
- Graphics and Graphics2D
- Visual Studio Code

Current Progress

The project now has a board that closely resembles a real Ludo board. All four player areas and tokens are visible on the screen. Although the tokens cannot move yet, the board structure required for future gameplay has been prepared successfully.

Problems Faced

While designing the board, I faced some challenges with positioning the board elements correctly. It took several adjustments to make the home areas, tokens, and center section appear properly within the game window.

Future Plan

In Week 4, I plan to:

- Improve the dice system.
- Implement player turn management.
- Display the current player's turn.
- Prepare the game logic needed for token movement.

Conclusion

Week 3 focused on developing the visual structure of the Ludo game. The board now looks much closer to a real Ludo board and includes player pieces. This provides a strong foundation for implementing gameplay features such as dice rolling, turn management, and token movement in the upcoming weeks.
