

WEEK 2 PROJECT REPORT

Project Title: Ludo Star Game

Introduction

In Week 2, I started working on the graphical user interface (GUI) of the Ludo Star game. In Week 1, I created the basic project structure and classes. This week, I focused on creating a visual interface so that the game can be played through a window instead of only showing output in the console.

Work Completed

During this week, I completed the following tasks:

- Created the main game window using Java Swing.
- Added a title for the game.
- Added three buttons: Roll Dice, New Game, and Exit.
- Created a basic board layout using colored sections for the four players.
- Connected the Roll Dice button so that it generates a random number between 1 and 6.
- Added a status area to display messages to the user.

Tools and Technologies Used

- Java
- Java Swing
- Visual Studio Code

Current Progress

The application now opens in a graphical window. The user can interact with the buttons and roll the dice. The board design is still in the early stage, but the basic layout has been created successfully.

Problems Faced

While working on the project, I faced some difficulties understanding how different Java classes work together and how GUI components are connected. After testing and making corrections, the program started working properly.

Future Plan

In Week 3, I plan to:

- Improve the board design.
- Create the actual Ludo board structure.
- Add player tokens on the board.
- Prepare the token movement system.

Conclusion

Week 2 was focused on developing the graphical interface of the project. The game has now moved from a simple console program to a graphical application. This provides a strong foundation for implementing the actual gameplay features in the coming weeks.
